## Foreword

Thank you for choosing Fluxcon PI500 Series Frequency Inverter. This product made by Fluxcon is based on years of experience in professional production and sale, and designed for variety of industrial machinery, fan and water pump drive unit and IF heavy-duty grinding unit.

This manual provides user the relevant precautions on installation, operational parameter setting, abnormal diagnosis, routine maintenance and safe use. In order to ensure correct installation and operation of the frequency converter, please carefully read this manual before installing it.

For any problem when using this product, please contact your local dealer authorized by this company or directly contact this company, our professionals are happy to serve you.

The end-users should hold this manual, and keep it well for future maintenance \& care, and other application occasions. For any problem within the warranty period, please fill out the warranty card and fax it to the our authorized dealer.

The contents of this manual are subject to change without prior notice. To obtain the latest information, please visit our website.

For more product information, please visit: http://

V-11. Air compressor constant pressure control (sensor for two-wire pressure transmitter) ..... 105
$\mathrm{V}-12$. frequency reference mode(external potentiometer, keyboard encoder) switching ..... 107

## Chapter 1.Inspection and safety precautions

Fluxcon frequency inverters have been tested and inspected before leaving factory. After purchasing, please check if its package is damaged due to careless transportation, and if the specifications and model of the product are consistent with your order requirements. For any problem, please contact your local authorized Fluxcon dealer or directly contact this company.

## 1-1.Inspection after unpacking

※ Check if that packing container contains this unit, one manual and one warranty card.
※ Check the nameplate on the side of the frequency inverter to ensure that the product you have received is right the one you ordered.

## 1-1-1.Instructions on nameplate

## 1-1-2.Model designation

Figure 1-2:Model Description

## 1－2．Safety precautions

Safety precautions in this manual are divided into the following two categories：
4．Danger：the dangers caused by failure to perform required operation，may result in serious injury or even death；

Caution：the dangers caused by failure to perform required operation，may result in moderate injury or minor injury，and equipment damage；

| Process | Type | Explanation |
| :---: | :---: | :---: |
| Before installation | 公Danger | －When unpacking，if control system with water，parts missed or component damaged are found，do not install！ <br> －If packing list does not match the real name，do not install！ |
| When installing | 合Danger | －Gently carry with care，otherwise there is the risk of damage to equipment！ <br> －Please do not use the damaged driver or the frequency inverter with missed pieces，otherwise there is the risk of injury！ <br> －Do not use your hand to touch the control system components， otherwise there is the risk of electrostatic damage！ |
|  | \} \  Note  | －Please install the unit on the metal or flame retardant objects； away from combustible material．Failure to do so may cause a fire！ －Never twist the mounting bolts of the equipment components， especially the bolt with the red mark！ |
| When wiring | 合 Danger | －Do not let the lead wires or screws fall into the driver．Otherwise which may cause damage to the driver！ <br> －Keep the driver installed in the place where less vibration，avoid direct sunlight． <br> －When two or more converters are installed in a cabinet，please pay attention to the installation location，ensure the good heat dissipation effect． |
|  | $\triangle$ Note | －Must comply with this manual＇s guidance，any construction shall be performed by a professional electrician，otherwise there would be the unexpected risk！ <br> －A circuit breaker must be set between the inverter and the power supply to separate them，otherwise it may cause a fire！ |
| Before energizing | 4 Danger | －Verify if power is a zero－energy status before wiring，otherwise there is a risk of electric shock！ <br> －The inverter shall be grounded correctly according to standard specifications，otherwise there is a danger of electrical shock！ <br> －Ensure that the distribution line meets the regional safety standards of EMC requirements．The diameter of used wire shall refer to the recommendations of this manual．Otherwise it may cause an accident！ <br> －Never directly connect braking resistor to the DC bus $\mathrm{P}(+)$ and $\mathrm{P}(-)$ terminals．Otherwise it may cause a fire！ <br> －Encoder must use the shielded wire，and the shielding layer must ensure the single－ended grounded！ |
| After energizing | 4 Danger | －Please confirm whether the input power voltage is same as the inverter rated voltage；wiring positions of power input terminals（ R ， $\mathrm{S}, \mathrm{T}$ ）and output terminals $(\mathrm{U}, \mathrm{V}, \mathrm{W})$ are correct or not；and note that if there is a short circuit in the peripheral circuit connected to driver，if the connected lines are tight，otherwise it may cause damage to the driver！ <br> －Do not need to perform withstand voltage test for any part of the inverter，this product has been tested before leaving factory． |

|  |  | Otherwise it may cause an accident！ |
| :---: | :---: | :---: |
| During operation | 4 Danger | －The inverter＇s cover plate must be closed before power on． Otherwise it may cause an electric shock！ <br> －Wiring of all external accessories must comply with the guidance of this manual，please correctly wiring in accordance with the circuit connection methods described in this manual．Otherwise it may cause an accident！ |
|  | $\triangle$ Note | －Do not open cover plate after energizing．Otherwise there is a risk of electric shock！ <br> －Do not touch the driver and peripheral circuits with wet hands． Otherwise there is a risk of electric shock！ <br> －Do not touch any input and output terminals of the inverter． Otherwise there is a risk of electric shock！ <br> －The inverter automatically perform the safety testing for the external strong electrical circuit in the early stages of energizing， therefore never touch the driver terminals $(\mathrm{U}, \mathrm{V}, \mathrm{W})$ or motor terminals，otherwise there is a risk of electric shock！ <br> －If you need to identify the parameters，please pay attention to the danger of injury during motor rotation．Otherwise it may cause an accident！ <br> －Please do not change the inverter manufacturer parameters． Otherwise it may cause damage to this unit！ |
| When maintaining | 合 Danger | －Do not touch the cooling fan and the discharge resistor to feel the temperature．Otherwise it may cause burns！ <br> －Non－professional personnel is not allowed to detect signal when operating．Doing so may cause personal injury or damage to this unit！ |
|  |  | －When the inverter is operating，you should avoid that objects fall into this unit．Otherwise cause damage to this unit！ <br> －Do not start／stop the driver by switching on／off contactor． Otherwise cause damage to this unit！ |
|  |  | －Do not perform repairs and maintenance for the live electrical equipment．Otherwise there is a risk of electric shock！ <br> －The repairs and maintenance task can be performed only when the inverter bus voltage is lower than 36 V ，Otherwise，the residual charge from capacitor would cause personal injury！ <br> －Non－well－trained professional personnel is not allowed to perform repairs and maintenance of inverter．Doing this may cause personal injury or damage to this unit！ <br> －After replacing the inverter，parameter settings must be redone， all pluggable plugs can be operated only in the case of powering off！ |

## 1－3．Precautions

| No． | Type | Explanation |
| :--- | :--- | :--- |
| 1 | Motor insulation <br> inspection | Please perform motor insulation inspection for the first time use， <br> re－use after leaving unused for a long time as well as regular <br> check，in order to prevent damage to the inverter because of the <br> motor＇s winding insulation failure．Wiring between motor and <br> inverter shall be disconnected，it is recommended that the 500 V <br> voltage type megger should be adopted and insulation resistance <br> shall be not less than 5M$\Omega$ |
| 2 | Motor thermal <br> protection | If the rated capacity of the selected motor does not match the <br> inverter，especially when the inverter rated power is greater than |

|  |  |  | the motor rated power, be sure to adjust the motor protection parameter values inside inverter or install thermal relay in the front of motor for motor protection. |
| :---: | :---: | :---: | :---: |
|  | 3 | Run over power frequency | The inverter output frequency rang is 0 Hz to 3200 Hz (Max.vector control only supports 300 Hz ). If the user is required to run at 50 Hz or more, please consider the endurance of your mechanical devices. |
|  | 4 | Vibrations of mechanical device | Inverter output frequency may be encountered mechanical resonance point of the load device, you can set jump frequency parameter inside inverter to avoid the case. |
|  | 5 | Motor heat and noise | The inverter output voltage is PWM wave that contains a certain amount of harmonics, so the temperature rise, noise and vibration of motor show a slight higher than frequency power frequency operation. |
|  | 6 | Output side with piezoresistor or capacitor for proving power factor | The inverter output is PWM wave, if the piezoresistor for lightning protection or the capacitor for improving power factor is installed in the output side, which easily cause the inverter instantaneous overcurrent or even cause damage to the inverter. Please do not use. |
|  | 7 | Contactor or switch used in the inverter input/output terminals | If contactor is installed between power supply and inverter, the contactor is not allowed to start/stop the inverter. Necessarily need to use the contactor to control the inverter start/stop, the interval should not be less than one hour. Frequent charging and discharging may reduce the service life of the inverter capacitor. If the contactor or switch is equipped between output terminals and motor, the inverter should be turned on/off without output status, otherwise which easily lead to damage to the inverter module. |
|  | 8 | Use other than the ratedvoltage | PI series inverter is not suitable for use beyond the allowable operating voltage described in this manual, which easily cause damage to the parts inside inverter. If necessary, please use the corresponding transformer to change voltage. |
|  | 9 | Never change 3phase input to 2phase input | Never change PI series 3-phase inverter to 2-phase one for application. Otherwise it will lead to malfunction or damage to the inverter. |
|  | 10 | Lightning surge protection | The series inverter is equipped with lightning overcurrent protection device, so it has the ability of self-protection to lightning induction. For the area where lightning is frequent, user should also install the extra protection in the front of the inverter. |
|  | 11 | High altitude and derating application | When the inverter is used in areas over 1000 m altitude, it is required to reduce frequency because the thin air will decrease the cooling effect of inverter. Please consult our technician for details on the application. |
|  | 12 | Special use | If the user need to use methods other than the suggested wiring diagram provided in this manual, such as common DC bus, please consult our technician. |
|  | 13 | Precautions for scrap disposal of the inverter | When electrolytic capacitors on the main circuit and printed circuit board as well as plastic parts are burned, it may produce toxic gases.Please disposing as industrial waste. |
|  | 14 | Adaptive motor | 1) Standard adaptive motor shall be four-pole asynchronous squirrel-cage induction motor or permanent magnet synchronous motor. Apart from the said motors, please select the inverter according to the motor rated current. <br> 2) The cooling fan and the rotor shaft for non-inverter motor are coaxially connected, the fan cooling effect is reduced when the |

|  |  |
| :---: | :---: |
| 15 | Others |

rotational speed is reduced, therefore, when the motor works in overheating occasions, a strong exhaust fan should be retrofitted or replace non-inverter motor with the inverter motor.
3) The inverter has built-in the adaptive motor standard parameters, according to the actual situation, please identify motor parameters or accordingly modify the default values to try to meet the actual value, otherwise it will operation affect and protection performance;
4) When short-circuit of cable or motor internal will activate the inverter alarm, even bombing. Therefore, firstly perform insulation short-circuit test for the initial installation of the motor and cable, routine maintenance often also need to perform such test. Note that the parts to be tested and the inverter shall be disconnected completely when testing.
1)We need to fix cover and lock before power on, so as to avoid the harm to personal safety that is caused by internal injuries of bad capacitors and other components.
2)Do not touch internal circuit board and any parts after powering off and within five minutes after keyboard indicator lamp goes out, you must use the instrument to confirm that internal capacitor has been discharged fully, otherwise there is a danger of electric shock. 3)Body static electricity will seriously damage the internal MOS field-effect transistors, etc., if there are not anti-static measures, do not touch the printed circuit board and IGBT internal device with hand, otherwise it may cause a malfunction.
4)The ground terminal of the inverter(E or $\stackrel{\perp}{=})$ shall be earthed firmly according to the provisions of the National Electrical Safety and other relevant standards. Do not shut down(power off) by pulling switch, and only cut off the power until the motor stopping operation.
5)It is required to add the optional input filter attachment so as to meet CE standards.

## 1-4.Scope of applications

※ This inverter is suitable for three-phase AC asynchronous motor and permanent magnet synchronous motor.
$※ \quad$ This inverter can only be used in those occasions recognized by this company, an unapproved use may result in fire, electric shock, explosion and other accidents.
※ If the inverter is used in such equipment (e.g: equipment for lifting persons, aviation systems, safety equipment, etc.) and its malfunction may result in personal injury or even death. In this case, please consult the manufacturer for your application.

Only the well-trained personnel can be allowed to operate this unit, please carefully read the instre1tions on safety, installation, operation and maintenance before use.

The safe operation of this unit depends on proper transport, installation, operation and maintenance!

## Chapter 2 Standard specifications

Note: PI500 inverter PI500 132G3/PI500 160F3 to PI500 630G3R/PI500 700F3R with " R"indicating a DC reactor, such as PI500-160G3R, PI500 160G4R.

The correct frequency inverter selection method is: consider inverter rated output current ,motor rated current, and the overload capacity .

The difference between the frequency inverter and the rated power of the motor generally recommends no more than two power segments;

Large frequency inverter with small motor, must accurately input motor parameters, can avoid motor overload and damage.

## 2-2.Standard specifications

|  | Items | Specifications |
| :---: | :---: | :---: |
| E <br> E <br> E <br> $\vdots$ <br> 0 <br> 0 |  | AC 1PH $220 \mathrm{~V}(-15 \%) \sim 240 \mathrm{~V}(+10 \%)$ |

|  | Rated voltage | AC 3PH $380 \mathrm{~V}(-15 \%) \sim 440 \mathrm{~V}(+10 \%)$ |
|  |  | AC 3PH $480 \mathrm{~V}(-10 \%) \sim 480 \mathrm{~V}(+10 \%)$ |
|  |  | AC 3PH $690 \mathrm{~V}(-10 \%) \sim 690 \mathrm{~V}(+10 \%)$ |

|  | Input frequency <br> Allowing fluctuations | 50Hz/60Hz |  |
| :---: | :---: | :---: | :---: |
|  |  | Voltage continued volatility: $\pm 10 \%$ | Less than 3\% of voltage unbalance rate $3 \%$; |
|  |  | Input frequency fluctuation: $\pm 5 \%$; | Distortion satisfy IEC61800-2 standard |
| E0000000 | Control system | High performance vector control inverter based on DSP |  |
|  | Control method | V/F control, vector control W/O PG, vector control W/ PG |  |
|  | Automatic torque boost function | Realize low frequency $(1 \mathrm{~Hz})$ and large output torque control under the V/F control mode. |  |
|  | Acceleration/decel eration control | Straight or S-curve mode. Four times available and time range is 0.0 to 6500.0s. |  |
|  | V/F curve mode | Linear, square root/m-th power, custom V/F curve |  |
|  | Over load capability | G type:rated current 150\%-1 minute, rated current $180 \%-2$ seconds F type:rated current 120\%-1 minute, rated current $150 \%-2$ seconds |  |
|  | Maximum frequency | 1, Vector control:0 to 300 Hz ; 2, V/F control:0 to 3200 Hz |  |
|  | Carrier Frequency | 0.5 to 16 kHz ; automatically adjust carrier frequency according to the load characteristics. |  |
|  | Input frequency resolution | Digital setting: 0.01 Hz minimum analog: 0.01 Hz . |  |
|  | Start torque | G type: $0.5 \mathrm{~Hz} / 150 \%$ (vector control W/O PG) F type: $0.5 \mathrm{~Hz} / 100 \%$ (vector control W/O PG) |  |
|  | Speed range | 1:100 (vector control W/O PG) 1:1000 (vector control W/ PG) |  |
|  | Steady-speed precision | Vector control W/O PG: $\leq \pm 0.5 \%$ (rated synchronous speed) Vector control W/ PG: $\leq \pm 0.02 \%$ (rated synchronous speed) |  |
|  | Torque response | $\leq 40 \mathrm{~ms}$ (vector control W/O PG) |  |
|  | Torque boost | Automatic torque boost; manual torque boost( $0.1 \%$ to $30.0 \%$ ) |  |
|  | DC braking | DC braking frequency: 0.0 Hz to max. frequency, braking time: 0.0 to 100.0 seconds, braking current value: $0.0 \%$ to $100.0 \%$ |  |
|  | Jogging control | Jog Frequency Range: 0.00 Hz to max. frequency; Jog Ac/deceleration time: 0.0 to 6500.0 s |  |
|  | Multi-speed operation | Achieve up to 16 -speed operation through the control terminal |  |
|  | Built-in PID | Easy to realize closed-loop control system for the process control. |  |
|  | Automatic voltage regulation(AVR) | Automatically maintain a constant output voltage when the voltage of electricity grid changes |  |
|  | Torque limit and control | "Excavator" feature - torque is automatically limited during the operation to prevent frequent overcurrent trip; the closed-loop vector mode is used to control torque. |  |
|  | Self-inspection of peripherals after power-on | After powering on, peripheral equipment will perform safety testing, such as ground, short circuit, etc. |  |
|  | Common DC bus function | Multiple inverter can use a common DC bus. |  |
|  | Quick current | The current limiting algorithm is used to reduce the inverter over |  |

|  | limiting |  | current probability, and improve whole unit anti-interference capability. |
| :---: | :---: | :---: | :---: |
|  | Timing control |  | Timing control function: time setting range( 0 m to 6500 m ) |
|  |  | Running method | Keyboard/terminal/communication |
|  |  | Frequency setting | 10 frequency settings available, including adjustable $\mathrm{DC}(0 \sim 10 \mathrm{~V} /-10 \sim$ $+10 \mathrm{~V})$, adjustable DC( 0 to 20 mA ), panel potentiometer, etc. |
|  |  | Start signal | Rotate forward/reverse |
|  |  | Multi-speed | At most 16 -speed can be set(run by using the multi-function terminals or program) |
|  |  | Emergency stop | Interrupt controller output |
|  |  | Wobbulate run | Process control run |
|  |  | Fault reset | When the protection function is active, you can automatically or manually reset the fault condition. |
|  |  | PID feedback signal | Including $\mathrm{DC}(0$ to 10 V$), \mathrm{DC}(0$ to 20 mA$)$ |
|  |  | Running status | Motor status display, stop, ac/deceleration, constant speed, program running status. |
|  |  | Fault output | Contact capacity :normally closed contact 3A/AC 250 V , normally open contact $5 \mathrm{~A} / \mathrm{AC} 250 \mathrm{~V}$, $1 \mathrm{~A} / \mathrm{DC} 30 \mathrm{~V}$. |
|  |  | Analog output | Two-way analog output, 16 signals can be selected such as frequency, current, voltage and other, output signal range ( 0 to $10 \mathrm{~V} / 0$ to 20 mA ). |
|  |  | Output signal | At most 4-way output, there are 40 signals each way |
|  | Run function |  | Limit frequency, jump frequency, frequency compensation, auto-tuning, PID control |
|  | DC current braking |  | Built-in PID regulates braking current to ensure sufficient braking torque under no overcurrent condition. |
|  | Running command channel |  | Three channels: operation panel, control terminals and serial communication port. They can be switched through a variety of ways. |
|  | Frequency source |  | Total 10 frequency sources: digital, analog voltage, analog current, multi-speed and serial port. They can be switched through a variety of ways. |
|  | Input terminals |  | 8 digital input terminals, compatible with active PNP or NPN input mode, one of them can be for high-speed pulse input( 0 to 100 kHz square wave); 3 analog input terminals for voltage or current input. |
|  | Output terminals |  | 2 digital output terminals, one of them can be for high-speed pulse output( 0 to 100 kHz square wave); one relay output terminal; 2 analog output terminals respectively for optional range ( 0 to 20 mA or 0 to 10 V ), they can be used to set frequency, output frequency, speed and other physical parameters. |
|  | Inverter protection |  | Overvoltage protection, undervoltage protection, overcurrent protection, overload protection, overheat protection, overcurrent stall protection, overvoltage stall protection, losting-phase protection (optional), communication error, PID feedback signal abnormalities, PG failure and short circuit to ground protection. |

## Chapter 3 Keyboard

## 3-1.Keyboard description

Figure 3-1:Operation panel display

## 3-2.Keyboard Indicators

| Indicator flag |  | Name |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | RUN | Running * ON: th * OFF: | light is wor stops |  |
|  | LOCAL/R <br> EMOTE | Command indicator light <br> That is the indicator for keyboard operation, terminal operation and remote operation (communication control) <br> * ON: terminal control working status <br> * OFF: keyboard control working status <br> * Flashing: remote control working status |  |  |
|  | FWD/REV | Forward/reverse running light <br> * ON: in forward status <br> * OFF: in reversal status |  |  |
|  | TUNE/TC | Motor self-learning/Torque control/Fault indicator <br> * ON: in torque control mode <br> * Slow flashing: in the motor tunning status <br> * Quick flashing: in the fault status |  |  |
|  | HzAV | $\begin{aligned} & \Gamma_{\mathrm{RPM}}^{\mathrm{Hz}} \\ & \mathrm{C}_{\mathrm{A}} \\ & \% \\ & \mathrm{~L} \\ & \mathrm{Cl} \end{aligned}$ | Hz | frequency unit |
|  |  |  | A | current unit |
|  |  |  | V | voltage unit |
|  |  |  | RPM | speed unit |
|  |  |  | \% | percentage |

## 3-3. Description of operation panel keys

| Sign | Name | Function |
| :---: | :---: | :---: |
| PRG | Parameter Setting/ Esc Key | * Enter into the modified status of main menu <br> * Esc from functional parameter modification <br> * Esc submenu or functional menu to status menu |
| $\xrightarrow{\text { sHIFT }}$ | Shift Key | *Choose displayed parameter circularly under running or stop interface; choose parameter's modified position when modify parameter |
|  | Increasing Key | Parameter or function number increasing,set by parameter F6.18. |
|  | Decreasing key | Parameter or function number decreasing, set by parameter F6.19. |
| RUN | Running key | For starting running in the mode of keyboard control status |
| $\frac{\text { STOP }}{\text { RST }}$ | Stop/Reset Key | *For stopping running in the running status; for resetting the operation in fault alarm status. The function of the key is subject to F6.00 |
| Enter | Running key | For starting running in the mode of keyboard control status |
| Quick | Quick multifunction key | This key function is determined by the function code F6.21. |
|  | Keyboard encoder | * In query status, function parameter increasing or decreasing <br> * In modified status, the function parameter or modified position increasing or decreasing. <br> * In monitoring status, frequency setting increasing or decreasing |

## 3-4.Keyboard display letters and numbers correspondence table

| Digital display area | $\begin{gathered} \text { Display } \\ \text { letters } \end{gathered}$ | Corresponding letters | Display | Corresponding | Display | Correspondi ng letters |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\square$ | 0 | 1 | 1 | $\Sigma$ | 2 |
|  | $\exists$ | 3 | 4 | 4 | 5 | 5 |
|  | 6 | 6 | 7 | 7 | $\theta$ | 8 |
|  | 9 | 9 | A | A | 6 | B |
|  | $\Gamma$ | C | $\checkmark$ | d | $E$ | E |
|  | $F$ | F | H | H | 1 | I |
|  | $L$ | L | $\Pi$ | N | $\pi$ | n |
|  | $\square$ | o | $P$ | P | $r$ | r |
|  | 5 | S | $t$ | t | $\pm$ | U |
|  | ${ }^{-}$ | T | - |  | - | - |
|  | 4 | y |  |  |  |  |

## 3-5.Examples of parameter settings

## 3-5-1. Instructions on viewing and modifying function code

PI500 inverter's operation pane is three levels menu for parameter setting etc.Three levels:
function parameter group (Level 1) $\rightarrow$ function code(level 2 ) $\rightarrow$ function code setting(level 3). The operation is as following:

Figure 3-2:Operation processes
Description: Back to the level 2 menu from level 3 menu by PRG key or ENTER key in the level 3 operation status. The differences between the two keys: ENTER will be back to the level 2 menu and save parameter setting before back, and transfer to the next function code automatically; PRG will be back to the level 2 menu directly, not save parameter setting, then back to current function code.

Example 1 Frequency setting to modify parameters
Set F0.01 from 50.00 Hz to 40.00 Hz

Example 2 :Restore factory settings

Without twinkling parameter position, the function code can not be modified in the level 3 menu. The reason maybe as following:

1) The function code can not be modified itself, eg: actual detecting parameters, running record parameters.
2) The function code can not be modified in the running status. It must be modified in the stop status.

## 3-5-2.The way to read parameters in various status

In stop or run status, operate shift key ther display a variety of status parameters respectively. Parameter display selection depends on function code F6.01 (run parameter 1), F6.02 (run parameter 2) and F6.03 (stop parameter 3).

In stop status, there are total 16 stop status parameters that can be set to display/not display: set frequency, bus voltage, DI input status, DO output status, analog input AIl voltage, analog input AI2 voltage, panel potentiometer input voltage, Actual count value, Actual length value, PLC running step number, Actual speed display, PID settings, high-speed pulse input frequency and reserve, switch and display the selected parameter by pressing key orderly.

In running status, there are 5 running-status parameters:running frequency,setting frequency,bus voltage,output voltage, output current default display, and other display parameters: output power, output torque, DI input status, DO output status, analog input AIl voltage, analog input AI2 voltage, panel potentiometer input voltage, Actual count value, Actual length value, linear speed, PID settings and PID feedback, etc, their display depends on function code F6.01 and F6.02 switch and display the selected parameter by pressing key orderly.

Inverter powers off and then powers on again, the displayed parameters are the selected parameters before power-off.

## 3-5-3.Password settings

The inverter has password protection. When y0.01 become not zero, it is the password and will be work after exit from function code modified status. Press PRG key again, will display"----". One must input the correct password to go to regular menu, otherwise, inaccessible.

To cancel the password protection function, firstly enter correct password to access and then set y 0.01 to 0 .

## 3-5-4.Motor parameter auto turning

Choose vector control, one must input the motor's parameters in the nameplate accurately before running the inverter. PI500 series frequency inverter will match the motor's standard
parameters according to its nameplate. The vector control is highly depend on motor's parameters. The parameters of the controlled motor must be inputted accurately for the good control performance.

Motor parameter auto tunning steps are as follows:
Firstly select command source $(\mathrm{F} 0.11=0)$ as the comment channel for operation panel, then input the following parameters according to the actual motor parameters (selection is based on the
current motor):

| Motor Selection | Parameters |
| :---: | :--- |
| Motor | b0.00: motor type selection b0.01: motor rated power |
|  | b0.02: motor rated voltage b0.03: motor rated current |
|  | b0.04: motor rated frequency b0.05: motor rated speed |

For asynchronous motors
If the motor can NOT completely disengage its load, please select 1 (asynchronous motor parameter static auto turning) for b 0.27 , and then press the RUN key on the keyboard panel.

If the motor can completely disengage its load, please select 2 (asynchronous motor parameter comprehensive auto turning) for b 0.27 , and then press the RUN key on the keyboard panel, the inverter will automatically calculate the motor's following parameters:

| Motor Selection | Parameters |
| :---: | :--- |
| Motor | b0.06:asynchronous motor stator resistance b0.07:asynchronous motor rotor <br> resistance <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> b0.08:asynchronous motor leakage inductance b0.09: asynchronous motor <br> mutual inductance <br> b0.10: asynchronous motor no-load current |

Complete motor parameter auto turning

## Chapter 4 Installation and commissioning

## 4-1.Installation direction and space

PI500 series inverter according to different power rating, the requirements of
around installation reserve space is different, specifically as shown below:

| Power rating | Dimension requirement |
| :---: | :---: |
| $0.75 \sim 7.5 \mathrm{~kW}$ | $\mathrm{~A} \geq 100 \mathrm{~mm} ; \mathrm{B} \geq 10 \mathrm{~mm}$ |
| $11 \sim 22 \mathrm{~kW}$ | $\mathrm{~A} \geq 200 \mathrm{~mm} ; \mathrm{B} \geq 10 \mathrm{~mm}$ |
| $30 \sim 75 \mathrm{~kW}$ | $\mathrm{~A} \geq 200 \mathrm{~mm} ; \mathrm{B} \geq 50 \mathrm{~mm}$ |
| $93 \sim 400 \mathrm{~kW}$ | $\mathrm{~A} \geq 300 \mathrm{~mm} ; \mathrm{B} \geq 50 \mathrm{~mm}$ |

Figure 4-1: PI500 Series Each power level installation space requirement
PI500 Series frequency inverter heat radiator circulated from bottom to top, when more than
one inverter work together, usually mounted side by side. In the case of the need to install them by upper and lower rows, due to the heat of the lower inverters rising to the upper equipment, fault maybe caused, heat insulation deflector and other objects to be installed.

Figure 4-2: Heat insulation deflector up and down installation diagram

## 4-2.Wiring Diagram

Frequency inverter wiring is divided by main circuit and control circuit. Users must properly connect frequency inverter in accordance with the wiring connection diagram showing below.

## 4-2-1.Wiring diagram

|  | GND | GND ground interface | GND jump line decide whether to connect PE, improve the inverter anti-interference |
|  | COM | COM ground interface | COM jump line decide whether to connect PE, improve the inverter anti-interference |
|  | H1 | COM Terminal interface | Consistent with the COM function on the terminal line 。 |

Signal input terminal circuit
Switch input and output signal transmission, generally use the shielded cable and wiring short distance as far as possible, good grounding and shielding layer on the inverter side, try not to over 20 m transmission distance. Drive in active way, elected to the power of crosstalk necessary filtering measures are taken, generally recommend that choose dry contact control mode.

Wiring control cable should be kept with the main circuit and high voltage lines (such as the power cord, motor connecting line, relay or contactor) more than 20 cm distance, and to avoid high voltage lines parallel to and can't be avoided and the high voltage lines cross, the proposal USES vertical wiring way, in order to prevent the misoperation caused by disturbance frequency converter

Dry contact mode:

Figure 4-16: signal input terminal circuit- dry contact mode
Note: using an external power supply, PLC and 24 v jumper cap must be removed, otherwise it will damage the product.

## Open collector NPN connect wire:

When the input signal from the NPN transistor, according to the use of power supply, please according to the figure +24 v and PLC jumper cap.

Inner power NPN connect mode

External power supply NPN connect mode

Figure 4-17: Signal input terminal wiring diagram, open collector NPN connection mode
Note: using an external power supply, PLC and 24 v jumper cap must be removed, otherwise it will damage the product.

## Open collector PNP connection mode:

Inner power PNP connect mode

External power supply PNP connect mode

Figure 4-18: Signal input terminal wiring diagram, open collector PNP connection mode
Note: using an external power supply, PLC and 24 v jumper cap must be removed, otherwise it will damage the product.

## 4-5.Wiring Precautions

| ADanger |
| :--- |
| Make sure that the power switch is in the OFF state before wiring operation, or electrical shock |
| may occur! |
| Wiring must be performed by a professional trained personnel, or this may cause damage to the |
| equipment and personal injury! |
| Must be grounded firmly, otherwise there is a danger of electric shock or fire hazard! |
| ANote |
| Make sure that the input power is consistent with the rated value of inverter, otherwise which |
| may cause damage to the inverter! |
| Make sure that the motor matches the inverter, otherwise which may cause damage to the |
| motor or activate the inverter protection! |
| Do not connect power supply to U, V, W terminals, otherwise which may cause damage to the |
| inverter! |
| Do not directly connect braking resistor to DC bus (P), (+) terminals, otherwise which may |
| cause a fire! |

※ The U,V,W output end of inverter can not install phase advancing capacitor or RC absorbing device. The inverter input power must be cut off when replacing the motor
※ Do not let metal chips or wire ends into inside the inverter when wiring, otherwise which may cause malfunction to the inverter.
※ Disconnect motor or switch power-frequency power supply only when the inverter stops output
※ In order to minimize the effects of electromagnetic interference, it is recommended that a surge absorption device shall be installed additionally when electromagnetic contactor and relay is closer from the inverter.
※ External control lines of inverter shall adopt isolation device or shielded wire.
※ In addition to shielding, the wiring of input command signal should also be aligned separately, it is best to stay away from the main circuit wiring.
※ If the carrier frequency is less than 3 KHz , the maximum distance between the inverter and the motor should be within 50 meters; if the carrier frequency is greater than 4 KHz , the distance should be reduced appropriately, it is best to lay the wiring inside metal tube.
※ When the inverter is additionally equipped with peripherals (filter, reactor, etc.), firstly measure its insulation resistance to ground by using 1000 volt megger, so as to ensure the measured value is no less than 4 megohms.
※ When the inverter need to be started frequently, do not directly turn power off, only the control terminal or keyboard or RS485 operation command can be used to control the start/stop operation, in order to avoid damage to the rectifier bridge.
※ To prevent the occurrence of an accident, the ground terminal( $\stackrel{\perp}{=})$ must be earthed firmly(grounding impedance should be less than 10 ohms), otherwise the leakage current will occur.
※ The specifications on wires used by the main circuit wiring shall comply with the relevant provisions of the National Electrical Code.
※ The motor's capacity should be equal to or less than the inverter's capacity.

## 4-6.Spare Circuit

When the inverter occurs the fault or trip, which will cause a larger loss of downtime or other unexpected faults. In order to avoid this case from happening, please additionally install spare circuit to ensure safety.

Note: Electrical diagram MCC1 and MCC2 interlock ac contactor; Spare circuit must be confirmed in advance and test running characteristics, make sure that the power frequency and frequency conversion phase sequence

Figure 4-19: Spare Circuit electrical diagram

## 4-7.Commissioning

Figure 4-20: Commissioning

- Firstly confirm that AC input power supply voltage shall be within inverter rated input voltage range before connecting power supply to the inverter.
- Connect power supply to the $R, S$ and $T$ terminals of the inverter.
- Select the appropriate operation control method.

## Chapter 5 Function parameter

## 5-1.Menu grouping

Note:
" $\star$ ": In running status, can not modify the parameter setting
"•": The actual testing data, can not be modified
" $\hat{\sim}$ ": In stop and run statuses, both can be changed;
" $\boldsymbol{\Delta}$ ": "Factory parameter", no change about it.
"." means the factory parameter is related to power or model. Please check the details in the involved parameter introduction.

Note:"Italic ${ }^{3}$ "means software version is C3.00 and the keyboard just like the above with MCU can do the functions.

Change limit refers to whether the parameters are adjustable.
y 0.01 is used for parameters protection password. Parameter menu can be enter into only after inputting the right password in the function parameter mode or user change parameter mode. When the y0.01 set to 0 , the password is canceled.

Parameter menu is not protected by password under user customized parameters mode.
F group is the basic function parameters,E group is to enhance function parameters, b group is a function of motor parameters, d group is the monitoring function parameters.

| Code | Parameter name | Functional Description |
| :---: | :---: | :---: |
| d0 | Monitoring function group | Monitoring frequency, current, etc |
| F0 | Basic function group | Frequency setting, control mode, acceleration and deceleration time |
| F1 | Input terminals group | Analog and digital input functions |
| F2 | Output terminals group | Analog and digital output functions |
| F3 | Start and stop control group | Start and stop control parameters |
| F4 | V/F control parameters | V/F control parameters |
| F5 | Vector control parameters | Vector control parameters |
| F6 | Keyboard and display | To set key and display function parameters |
| F7 | Auxiliary function group | To set Jog, jump frequency and other auxiliary function parameters |
| F8 | Fault and protection | To set fault and protection parameters |
| F9 | Communication parameter group | To set MODBUS communication function |
| FA | Torque control parameters | To set parameters under torque control mode |
| Fb | Control optimization parameters | To set parameters of optimizing the control performance |
| FC | Extend parameters group | specialapplicationparameterssetting |
| E0 | Wobbulate, fixed-length and counting | To set Wobbulate, fixed-length and counting function parameters |
| E1 | Multi-stage command, simple PLC | Multi-speed setting, PLC operation |
| E2 | PID function group | To set Built-in PID parameters |
| E3 | Virtual DI, Virtual DO | Virtual I/O parameter setting |
| b0 | Motor parameters | To set motor parameter |
| y0 | Function code management | To set password, parameter initialization and paramete group display |

## Chapter 5 Function parameter

The function of digital multifunction input terminal DI1-DI8 (DI5 can be used as a high-speed pulse input terminal), can be set by parameter F1.00-F1.07, and the optional function is shown in the following table:

| Set value | Function | Description |
| :---: | :---: | :---: |
| 0 | No function | The terminal for not use can be set to "no function" to prevent accidental operation. |
| 1 | Forward run (FWD) | External terminals are used to control the FWD/REV run mode of inverter. |
| 2 | Reverse run (REV) |  |
| 3 | Three-wire operation control | This terminal is used to determine the inverter's threewire control mode. For details, please refer to the instructions of function code F1.10 ("terminal command mode). |
| 4 | Forward JOG(FJOG) | FJOG means Forward JOG running, RJOG means Reverse JOG running. For Jog running frequency and $\mathrm{Jog} \mathrm{Ac} /$ deceleration time, please refer to the description of the function code F7.00, F7.01, F7.02. |
| 5 | Reverse JOG(RJOG) |  |
| 6 | Terminal UP | Modify frequency increment/decrement command when the frequency is referenced by external terminal. Adjust up/down the set frequency when the digital setting is selected as the frequency source. |
| 7 | Terminal DOWN |  |
| 8 | Free stop | The inverter output is blocked, at the time, the parking process of motor is not controlled by the inverter. This way is same as the principle of free stop described in F3.07. |
| 9 | Fault reset (RESET) | The function make use of terminal for fault reset. It has same function with RESET key on the keyboard. This function can be used to realize remote fault reset. |
| 10 | Run pausing | The inverter slows down and stops, but all operating parameters are memorized. Such as PLC parameters, wobbulate frequency parameters, and PID parameters. This terminal signal disappears, the inverter reverts to the previous state of running before parking. |
| 11 | External fault normally open input | When the signal is sent to the inverter, the inverter reports fault Err.15, and performs troubleshooting according to fault protection action (for details, please refer to the function code F8.17). |
| 12 | Multi-speed terminal 1 | The setting of 16 stage speed or 16 kinds of other command can be achieved through the 16 states of the four terminals. For details, see Table 1 |
| 13 | Multi-speed terminal 2 |  |
| 14 | Multi-speed terminal 3 |  |
| 15 | Multi-speed terminal 4 |  |
| 16 | Ac/deceleration time selection terminal 1 | The selection of $4 \mathrm{ac} /$ deceleration times can be achieved through the 4 states of the two terminals. For details, see Table 2 |
| 17 | Ac/deceleration time selection terminal 2 |  |

| 18 | Frequency source switching | Used to switch between different frequency sources. According to frequency source selection function code (F0.07) settings, the terminal is used to switch between two frequency sources. |
| :---: | :---: | :---: |
| 19 | UP/DOWN setting (terminal, keyboard) | When the frequency reference is the digital frequency, this terminal is used to clear the changed frequency value by terminal UP/DOWN or keyboard UP/DOWN, so that the reference frequency can recover to the set value of F 0.01 . |
| 20 | Run command switch terminal 1 | When the command source is set to the terminal control (F0.11 = 1), the terminal can be used to switch between terminal control and keyboard control. When the command source is set to the communication control (F0.11 $=2$ ), the terminal can be used to switch between communication control and keyboard control. |
| 21 | Ac/deceleration prohibited | Ensure the inverter is free from external signals affect (except for shutdown command), maintain current output frequency. |
| 22 | PID pause | PID is temporarily disabled, the inverter maintains current output frequency, no longer performs PID adjustment of frequency source. |
| 23 | PLC status reset | When PLC pauses and runs again, this terminal is used to reset the inverter to the initial state of simple PLC. |
| 24 | Wobbulate pause | When the inverter outputs at center frequency. Wobbulate will pause |
| 25 | Counter input | Input terminal of the count pulse |
| 26 | Counter reset | Clear counter status |
| 27 | Length count input | Input terminal of the length count. |
| 28 | Length reset | Clear length |
| 29 | Torque control prohibited | When the inverter torque control is prohibited, the inverter will enter speed control mode. |
| 30 | High-speed pulse input (only valid for DI5 ) | DI5 is used as pulse input terminal. |
| 31 | Reserve | Reserve |
| 32 | Immediately DC braking | If the terminal is active, the inverter switches directly to DC braking status |
| 33 | External fault normally closed input | When the signal of external fault normally closed input is inputted into the inverter, the inverter will report fault Err. 15 and shutdown. |
| 34 | Frequency change enable | If the function is set to be valid, when the frequency changes, the inverter does not respond to frequency changes until the terminal state is invalid. |
| 35 | PID action direction as reverse | If the terminal is valid, PID action direction opposites to the direction set by E2.03 |
| 36 | External parking terminal 1 | Under keyboard control mode, the terminal can be used to stop the inverter, same as STOP key on the keyboard. |
| 37 | Control command switch terminal 2 | Used to switch between terminal control and communication control. If the command source is selected as terminal control, the system will be switched to the communication control mode when the terminal is active; vice versa. |

## 5－1－4．F2 Group－Output terminals group

| No． | Code | Parameter name | Setting range |  | Factory <br> setting | Chan－ |
| :---: | :--- | :--- | :--- | :---: | :---: | :---: |
| ge |  |  |  |  |  |  |$|$

Above 5 function code is used to select five digital output function．Multifunctional output terminal functions are as follows：

| Setting <br> value | Functions | Description |
| :---: | :--- | :--- |
| 0 | No output | No output action |
| 1 | Inverter running | Inverter is in running state，the output frequency（can be <br> zero），the output ON signal． |
| 2 | Fault output（fault <br> down ） | When the drive fails and downtime，the output ON signal． |
| 3 | Frequency level <br> detection FDT1 output | Please refer to the function code F7．23，F7．24＇s <br> instructions． |
| 4 | Frequency arrival | Please refer to the description of function code F7．25． |
| 5 | Zero－speed running（no | Inverter operation and the output frequency is 0，output |

|  | output when shutdown) | ON signal. When the drive is shut down, the signal is OFF. |
| :---: | :---: | :---: |
| 6 | Motor overload prealarm | Before the motor overload protection, according to the overload pre-alarm threshold value judgment, more than the pre-alarm threshold value output ON signal. Motor overload parameter settings refer to the function code F8.02~F8.04. |
| 7 | Inverter overload prealarm | Before the inverter overload occurs 10s, output ON signal. <br> Setup counter arrive |
| 8 | Setup counter arrive | When the count reaches the set value of E0.08, output ON signal. <br> Specifies the count value reaches |
| 9 | Specifies the count value reaches | When the count reaches the set value of E0.09, output ON signal. Counting Function Reference E0 group |
| 10 | Length arrival | When the actual length of the detection of more than E 0.05 set length, output ON signal. |
| 11 | PLC cycle is complete | After simple PLC completes one cycle, the output of a pulse width of 250 ms signal. |
| 12 | Total running time arrival | Inverter total running time of more than F7.21 F6.07 set time, the output ON signal. |
| 13 | Limited in frequency | When the set frequency exceeds the upper limit frequency or lower frequency, and output frequency is beyond the upper limit frequency or lower limit frequency, output ON signal. |
| 14 | Torque limiting | Drive under the speed control mode, when the output torque reaches the torque limit, the inverter is stall protection status, while the output ON signal. |
| 15 | Ready to run | When the inverter main circuit and control circuit power supply has stabilized, and the drive does not detect any fault information, the drive is in an operational state, output ON signal. |
| 16 | AI1>AI2 | When the value of the analog input AI is greater than the value of AI2 input and output ON signal. |
| 17 | Upper frequency arrival | When the operating frequency reaches the upper frequency, output ON signal. |
| 18 | The lower frequency arrival (no output when shutdown) | When the operating frequency reaches the lower frequency, output ON signal. The next stop status signal is OFF. |
| 19 | Under voltage state output | When the inverter is in an undervoltage condition, output ON signal. |
| 20 | Communication setting | Refer to the communication protocol. |
| 21 | Reserve | Reserve |
| 22 | Reserve | Reserve |
| 23 | Zero-speed operation 2 (shutdown also output) | The inverter's output frequency is 0 , output ON signal. The signal is also ON when shutdown. |
| 24 | Cumulative power-on time arrival | When the inverter's accumulated power on time (F6.08) over F7.20 the set time, the output ON signal. |
| 25 | Frequency level detection FDT2 output | Please refer to the function code F7.26, F7.27's instructions. |

Chapter 5 Function parameter

Chapter 5 Function parameter

|  | 5 | Output voltage $\quad 0 \sim 1.2$ ti | $0 \sim 1.2$ times inverter rated voltage |  |  |

## Chapter 6 Troubleshooting

## 6-1.Fault alarm and countermeasures

PI500 inverter system operation in the process of failure, the inverter will protect the motor immediately to stop the output, while the inverter fault relay contact action. Inverter panel will display the fault code, the fault code corresponding to the type of fault and common solutions refer to the following table. List for reference only, please do not repair, transformation, if you can not get rid of the trouble, please division or product agents to seek technical support.

| No. | Fault ID | Failure type | Possible causes | Solutions |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Err. 01 | Inverter unit protection | 1.the short circuit of inverter output happens <br> 2.the wiring for the motor and the inverter is too long 3.module overheating 4.the internal wiring of inverter is loose <br> 5.the main control panel is abnormal <br> 6.the drive panel is abnormal. <br> 7.the inverter module is abnormal | 1.eliminate peripheral faults 2.additionally install the reactor or the output filter 3.check the air duct is blocked or not and the fan is working normally or not, and eliminate problems <br> 4.correctly plug all cables 5.seek for technical support |
| 2 | Err. 02 | Acceleration overcurrent | 1.the acceleration time is too short <br> 2. manual torque boost or $\mathrm{V} / \mathrm{F}$ curve is not suitable <br> 3.the voltage is low <br> 4.the short-circuit or earthing of inverter output happens 5.the control mode is vector and without identification of parameters <br> 6.the motor that is rotating is started unexpectedly. <br> 7.suddenly increase the load in the process of acceleration. <br> 8.the type selection of inverter is small | 1.increase acceleration time 2.adjust manual torque boost or V/F curve <br> 3.set the voltage to the normal range <br> 4.eliminate peripheral faults 5.perform identification for the motor parameters <br> 6.select Speed Tracking Start or restart after stopping the motor. 7.cancel the sudden load 8.choose the inverter with large power level |
| 3 | Err. 03 | Deceleration overcurrent | 1.the short-circuit or earthing of inverter output happens 2.the control mode is vector and without identification of parameters <br> 3.the deceleration time is too short <br> 4.the voltage is low <br> 5.suddenly increase the load in the process of deceleration. <br> 6.didn't install braking unit and braking resistor | 1.eliminate peripheral faults <br> 2.perform identification for the motor parameters <br> 3.increase the deceleration time 4. set the voltage to the normal range <br> 5.cancel the sudden load 6.install braking unit and brake resistor |

## 6-2.EMC (Electromagnetic Compatibility)

## 6-2-1.Definition

Electromagnetic compatibility refers to the ability that the electric equipment runs in an electromagnetic interference environment and implements its function stably without interferences on the electromagnetic environment.

## 6-2-2.EMC standard

In accordance with the requirements of the Chinese national standard $\mathrm{GB} / \mathrm{T} 12668.3$, the inverter must comply with the requirements of electromagnetic interference and antielectromagnetic interference.

Our existing products adopt the latest international standards: IEC/EN61800-3: 2004 (Adjustable speed electrical Power drive systems Part 3: EMC requirements and specific test methods), which is equivalent to the Chinese national standards GB/T12668.3. EC/EN61800-3 assesses the inverter in terms of electromagnetic interference and anti-electronic interference. Electromagnetic interference mainly tests the radiation interference, conduction interference and harmonics interference on the inverter (necessary for civil inverter).

Anti-electromagnetic interference mainly tests the conduction immunity, radiation immunity, surge immunity, EFTB(Electrical Fast Transient Burs) immunity, ESD immunity and power low frequency end immunity (the specific test items includes: 1. Immunity tests of input voltage sag,
 frequency change; 5 . input voltage unbalance; 6 . input voltage fluctuation). The tests shall be conducted strictly in accordance with the above requirements of IEC/EN61800-3, and our products are installed and used according to the guideline of the Section 7.3 and can provide good electromagnetic compatibility in general industry environment.

## 6-3.EMC directive

## 6-3-1.Harmonic effect

The higher harmonics of power supply may damage the inverter. Thus, at some places where the quality of power system is relatively poor, it is recommended to install AC input reactor.

## 6-3-2.Electromagnetic interference and installation precautions

There are two kinds of electromagnetic interference, one is the interference from electromagnetic noise in the surrounding environment to the inverter, and the other is the interference from the inverter to the surrounding equipment.

Installation Precautions:
1)The earth wires of the Inverter and other electric products ca shall be well grounded;
2)The power cables of the inverter power input and output and the cable of weak current signal (e.g. control line) shall not be arranged in parallel but in vertical if possible.

3 ) It is recommended that the output power cables of the inverter shall use shield cables or steel pipe shielded cables and that the shielding layer shall be grounded reliably, the lead cables of the equipment suffering interferences shall use twisted-pair shielded control cables, and the shielding layer shall be grounded reliably.
4)When the length of motor cable is longer than 50 meters, it needs to install output filter or reactor.

## 6-3-3.Remedies for the interference from the surrounding electromagnetic equipment to the inverter

Generally the electromagnetic interference on the inverter is generated by plenty of relays, contactors and electromagnetic brakes installed near the inverter. When the inverter has error action due to the interference, the following measures is recommended:

1) Install surge suppressor on the devices generating interference;
2) Install filter at the input end of the inverter, please refer to Section 6.3 .6 for the specific operations.
3) The lead cables of the control signal cable of the inverter and the detection line shall use the shielded cable and the shielding layer shall be grounded reliably.

## 6-3-4.Remedies for the interference from the inverter to the surrounding electromagnetic equipment

These noise interference are classified into two types: one is the radiation interference of the inverter, and the other is the conduction interference of the inverter. These two types of interference cause that the surrounding electric equipment suffer from the affect of electromagnetic or electrostatic induction. Further, the surrounding equipment produces error action. For different interference, please refer to the following remedies:

1) Generally the meters, receivers and sensors for measuring and testing have more weak signals. If they are placed nearby the inverter or together with the inverter in the same control cabinet, they easily suffer from interference and thus generate error actions. It is recommended to handle with the following methods: away from the interference source as far as possible; do not arrange the signal cables with the power cables in parallel and never bind them together; both the signal cables and power cables shall use shielded cables and shall be well grounded; install ferrite magnetic ring (with suppressing frequency of 30 to $1,000 \mathrm{MHz}$ ) at the output side of the inverter and wind it 2 to 3 turns; install EMC output filter in more severe conditions.
2) When the interfered equipment and the inverter use the same power supply, it may cause conduction interference. If the above methods cannot remove the interference, it shall install EMC filter between the inverter and the power supply (refer to Section 6.3.6 for the selection operation);
3) The surrounding equipment shall be separately grounded, which can avoid the interference caused by the leakage current of the inverter's grounding wire when common grounding mode is adopted.

## 6-3-5. Remedies for leakage current

There are two forms of leakage current when using the inverter. One is leakage current to the earth, and the other is leakage current between the cables.

1) Factors of affecting leakage current to the earth and its solutions:

There are the distributed capacitance between the lead cables and the earth. The larger the distributed capacitance, the larger the leakage current; the distributed capacitance can be reduced by effectively reducing the distance
between the inverter and the motor. The higher the carrier frequency, the larger the leakage current. The leakage current can be reduced by reducing the carrier frequency. However, the carrier frequency reduced may result in
the increase of motor noise.Please note that additional installation of reactor is also an effective method to solve leakage current problem.

The leakage current may increase with the increase of circuit current. Therefore, when the motor power is higher, the corresponding leakage current will be higher too.
2) Factors of producing leakage current between the cables and its solutions:

There is the distributed capacitance between the output cables of the inverter. If the current passing lines has higher harmonic, it may cause resonance and thus result in leakage current. If the thermal relay is used, it may generate error action.

The solution is to reduce the carrier frequency or install output reactor. It is recommended that the thermal relay shall not be installed in the front of the motor when using the inverter, and that electronic over current protection function of the inverter shall be used instead.

## 6-3-6. Precautions on installing EMC input filter at the input end of

 power supply1) Note: when using the inverter, please follow its rated values strictly. Since the filter belongs to Classification I electric appliances, the metal enclosure of the filter and the metal ground of the installing cabinet shall be well earthed in a large area, and have good conduction continuity, otherwise there may be danger of electric shock and the EMC effect may be greatly affected. Through the EMC test, it is found that the filter ground end and the PE end of the inverter must be connected to the same public earth end, otherwise the EMC effect may be greatly affected.
2) The filter shall be installed at a place close to the input end of the power supply as much as possible.

## Chapter 8 Maintenance and repair

## 8-1.Inspection and maintenance

During normal use of the inverter, in addition to routine inspections, the regular inspections are required (e.g. the overhaul or the specified interval, and the interval shall not exceed 6 months), please refer to the following table to implement the preventive measures.

| Check Date |  | Check Points | Check Items | Check to be done | Method | Criterion |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Routine | $\begin{aligned} & \text { Regu } \\ & \text {-lar } \\ & \hline \end{aligned}$ |  |  |  |  |  |
| $\checkmark$ |  | Display | $\begin{aligned} & \hline \text { LED } \\ & \text { display } \end{aligned}$ | Whether display is abnormal or not | Visually check | $\begin{aligned} & \text { As per } \\ & \text { use status } \end{aligned}$ |
| $\checkmark$ | $\checkmark$ | Cooling system | Fan | Whether abnormal noise or vibration exists or not | Visually and audibly check | No abnormal |
| $\checkmark$ |  | Body | Surroun <br> ding <br> conditio <br> ns | Temperature, humidity, dust, harmful gas. | Visually check with smelling and feeling | As per Section $2-1$ |
| $\checkmark$ |  | Input/o utput termina Is | Voltage | Whether input/output voltage is abnormal or not | Test R, S, T and U, V, W terminals | As per standard specifications |
|  | $\checkmark$ | Main circuit | Overall | Whether these phenomenon of loose fastenings, overheat, discharging, much dust, or blocked air duct exist or not | Visually check, tighten and clean | No abnormal |
|  |  |  | Electrol ytic capacita nce | Whether appearance is abnormal or not | Visually check | No abnormal |
|  |  |  | Wires and conduct ing bar | Whether they are loose or not | Visually check | No abnormal |
|  |  |  | Termina ls | If screws or bolts are loose or not | Tighten | No abnormal |

$" \sqrt{ }$ " means routine or regular check to be needed
Do not disassemble or shake the device gratuitously during check, and never unplug the connectors, otherwise the system will not run or will enter into fault state and lead to component failure or even damage to the main switching device such as IGBT module.

The different instruments may come to different measurement results when measuring. It is recommended that the pointer voltmeter shall be used for measuring input voltage, the rectifier voltmeter for output voltage, the clamp-on ammeter for input current and output current, and the electric wattmeter for power.

## 8-2.Parts for regular replacement

To ensure the reliable operation of inverter, in addition to regular care and maintenance, some internal mechanical wear parts(including cooling fan, filtering capacitor of main circuit for energy storage and exchange, and printed circuit board) shall be regularly replaced. Use and replacement for such parts shall follow the provisions of below table, also depend on the specific application environment, load and current status of inverter.

| Name of Parts | Standard life time |
| :---: | :---: |
| Cooling fan | 1 to 3 years |
| Filter capacitor | 4 to 5 years |
| Printed circuit board(PCB) | 5 to 8 years |

## 8-3.Storage

The following actions must be taken if the inverter is not put into use immediately(temporary or long-term storage) after purchasing:
※ It should be store at a well-ventilated site without damp, dust or metal dust, and the ambient temperature complies with the range stipulated by standard specification
※ Voltage withstand test can not be arbitrarily implemented, it will reduce the life of inverter. Insulation test can be made with the 500 -volt megger before using, the insulation resistance shall not be less than $4 \mathrm{M} \Omega$.

## 8-4.Capacitor 8-4-1.Capacitor rebuilt

If the frequency inverter hasn't been used for a long time, before using it please rebuilt the DC bus capacitor according the instruction. The storage time is counted from delivery.

| Time | Operation instruction |
| :---: | :---: |
| Less than 1 year | No need to recharge |
| Between 1~2 years | Before the first time to use, the frequency inverter must be recharged for one hour |
| Between 2~3years | Use adjustable power to charge the frequency inverter: $--25 \%$ rated power 30 minutes, <br> -- $50 \%$ rated power 30 minutes, <br> -- $75 \%$ rated power 30 minutes, <br> --Last $100 \%$ rated power 30 minutes, |
| More than 3 years | Use adjustable power to charge the frequency inverter: <br> $--25 \%$ rated power 2hours, <br> --50\% rated power 2 hours, <br> -- $75 \%$ rated power 2hours, <br> -- Last $100 \%$ rated power 2 hours. |

Instruction of using adjustable power to charge the frequency inverter:
The adjustable power is decided by the frequency inverter input power, for the single phase $/ 3$ phase 220 v frequency inverter, we uase $220 \mathrm{v} \mathrm{AC} / 2 \mathrm{~A}$ Regulator. Both single phase and three phase frequency inverter can be charged by single phase Power Surge( $\mathrm{L}+$ connect R,N connects T) Because it is the same rectifier, so al 1 the DC bus capacitor will be charged at the same time.

You should make sure the voltage ( 380 v ) of high voltage frequency inverter, because when the capacitor being charged it almost doesn't need any current, so small capacitor is enough(2A)

The instruction of using resisitor( incandescent lights) to charge frequency inverters:
When charge the DC bus capacitor of drive system by connecting power directly, then the time should not be less than 60 minutes. The operation should be carried on under the condition of normal temperature and without load, and moreover ,should be added resistor in the power supply cycle.

380 V drive system: use $1 \mathrm{~K} / 100 \mathrm{~W}$ resistor. When the power is less than 380 v , 100 w incandescent lights is also suitable. When using incandescent lights, the lights will extinct or become very weak.

Figure 8-1:380V Drive equipment charging circuit example

## 8-5.Measuring and readings

※ If a general instrument is used to measure current, imbalance will exists for the current at the input terminal. generally, the deviation is not more than $10 \%$, that is normal. If the deviation exceeds $30 \%$, please inform the original manufacturer to replace rectifier bridge, or check if the deviation of three-phase input voltage is above 5 V or not.
※ If a general multi-meter is used to measure three-phase output voltage, the reading is not accurate due to the interference of carrier frequency and it is only for reference.

## Chapter 9 Options

## 1.Power cables

The dimension of input power cable and motor cable should meet the local provision:
Input power cable and motor cable should bear the related load current.
The maximum rated temperature margin conditions of the motor cable should not be sustained below 70 degrees.

Conductivity of the PE conductor and phase conductor capacity are the same(same crosssectional area),

About EMC requirements, see "EMC Guidance Content"
To meet the CE EMC requirements, a symmetrical shielded motor cable must be used (see figure below).For input cables can use four-core cable, but still recommended to use shielded symmetrical cable. Compared to a four-core cable, shielded symmetrical cables can not only reduce the loss and cost of the current flowing through the motor cable, but also can reduce the electromagnetic radiation.

Note: If conductivity of the cable shield can not meet the requirements, you must use a separate PE conductor.

To play a protective role of conductor, when the shield wire and phase conductors using the same material, the cross-sectional area of the shield wire and phase conductors cross-sectional area must be the same, aims to reduce grounding resistance, impedance continuity better.

To effectively suppress RFI transmission and conduction, the shield conductivity must be at least $1 / 10$ of the phase conductor conductivity. For copper or aluminum shield, this requirement is very easy to meet. Minimum requirements for the drive motor cable as shown below. Cable comprising a layer of copper spiral. Shield tight as possible, that the more tightly the more we can effectively suppress radiated electromagnetic interference.

## 2. Control Cable

All analog control cables and cables for the frequency input must be shielded. Analog signal cable double-shielded twisted pair cable as shown in Figure 1. Each signal uses one pair individually shielded twisted pair cable pair. Do not use the different analog signal with a ground wire.

For low-voltage digital signals, double-shielded cable is the best choice, but can also be a single-shielded or unshielded twisted pair, as shown in Figure 2, however, the frequency of the signal, it can only use a shielded cable.

Relay cable need to use cables with metal braid shield.
Need to use a network cable to connect the keyboard, for electromagnetic environment is more complex place, it is recommended to use shielded cable.

Note: analog and digital signals using different cables routed separately.

## 3..Interference Counte

Connect noise filter on the output side of inverter can reduce inductive interference and radio interference.
$\rightarrow$ Inductive interference : The electromagnetic induction makes the signal line noise when upload signal ,and then cause the control equipment malfunction.
$\rightarrow$ Wireless interference : The high-frequency electromagnet wave emitted by the inverter and cables will interfere with the nearby wireless device and make it noise when receiving signal.
$\rightarrow$ Installation of noise filter as below :

(1) Inductive interference countermeasure : in addition to the installation of noise filter, it can also import the output cables to grounded metal tube. The distance between the output cable and signal line is greater than 30 cm , the influence of inductive interference is also significantly reduced. As shown below :

(2) Radio frequency (RF) interference countermeasure : the input cables, output cables and inverter itself can produce interference, to install noise filter on both sides of input and output and shield the inverter with metal box can reduce the radio frequency interference. As shown below :

## Chapter 10 Warranty

The product quality shall comply with the following provisions (overseas market):

1. Warranty terms

1-1. The product from the ex-factory date, the warranty period of 18 months( except non-standard products), It is based on factory records.

1-2. The product from the ex-factory date. if the product appear quality problem within the normal operating range. we provide free warranty under 18 months.

1-3. The product from the ex-factory date, enjoy lifelong compensable service.
If there is a contract, we will according to the priority principle of the contract.

## 2. Exceptions clause

If belongs to the quality problems caused by following reasons products, we provide compensable service even though under the warranty. we will charge a maintenance fee.

2-1. The user is not in accordance with the "products manual" is used method of operation
caused the failure.
2-2. Users without permission to alteration or repair caused by product failure.
$2-3$. Users beyond the standard specifications require the use of the inverter caused by product failure.
2-4. Users to buy and then fell loss or damage caused by improper handling.
2-5.Because the user use adverse environment (such as: Humid environment, Acid and alkaline corrosion gas and so on) lead to product failure.

2-6. Due to the fault cause of earthquake, fire, lightning, wind or water disaster, abnormal
voltage irresistible natural disasters.
2-7. Damaged during shipping ,but users are not rejected goods.
3. The following conditions, manufacturers have the right not to be warranty.

3-1. No product nameplate or product nameplate blurred beyond recognition.
3-2. Not according to the purchase contract agreement to pay the money.
3-3. For installation, wiring, operation, maintenance and other users can not describe the objective reality to the company's technical service center.
4. About the repair fee, according to our company latest price list as a standard.
5. When the products is broken, please complete the form and warranty card, shipping with the failure machine to our company.Fluxcon reserve the right to explain the terms of the event.

## Appendix I RS485 Communication protocol

## I-1 Communication protocol

## I-1-1 Communication content

This serial communication protocol defines the transmission information and use format in the series communication Including: master polling( or broadcast) format; master encoding method, and contents including: function code of action, transferring data and error checking. The response of slave also adopts the same structure, and contents including: action confirmation, returning the data and error checking etc. If slave takes place the error while it is receiving information or cannot finish the action demanded by master, it will send one fault signal to master as a response.

Application Method
The inverter will be connected into a "Single-master Multi-slave" PC/PLC control network with RS485 bus.

## Bus structure

(1)Transmission mode

Asynchronous series and half-duplex transmission mode. For master and slave, only one of them can send the data and the other only receives the data at the same time. In the series asynchronous communication, the data is sent out frame by frame in the form of message
(2)Topological structure

Single-master and multi-slave system. The setting range of slave address is 0 to 247 , and 0 refers to broadcast communication address. The address of slave for network must be exclusive.

Figure I-3 is the single inverter and PC set up MODBUS field wiring diagram. Because computers are generally not with RS485 interface, the computer must be built-in RS232 interface or USB interface through the converter to convert to RS485. Connect the T + of converter with 485 + terminal of the inverter, Connect the T- of converter with 485- terminal of inverter. We recommended to use a shielded twisted pair. When adopting the RS232-485 converter,RS232 interface connected with RS232-RS485 RS232 interface, the cable should be as short as possible, 15 meters at the longest, we recommend to plug the RS232-RS485 with computer in pair directly. Similarly, when using the USB-RS485 converter, cable should be as short as possible.

When the line is connected, connect the right port of the host computer on the computer to (RS232-RS485 converter port, such as COM1), and set the basic parameters and the baud rate and data bit parity and so on consistent with the inverter.

Figure I-3
Multiple Applications
In reality, multi-machine applications, there are two connections
The first inverter and the last inverter short the terminal resistor on the control board to be active. As shown in Figure I-4

Figure I-4
The two longest distance inverter from the device shall short the terminal resistor on the control board to be active. As shown in Figure I-5:

Figure I-5
Multi-machine connection should try to use a shielded cable. The basic parameters such as baud rate and data bit of all of the devices on RS485 line must be the same, address must be different.

NOTE: The terminal resistor of 485 decides valid or invalid through the control board (No. 485) jumper

## I-1-2 Protocol description

PI500 series inverter communication protocol is a asynchronous serial master-slave
communication protocol, in the network, only one equipment(master) can build a protocol (known as "Inquiry/Command"). Other equipment(slave) only can response the "Inquiry/Command"of master by providing data or perform the corresponding action according to the "Inquiry/ Command"of master. Here, the master refers to a Personnel Computer(PC), an industrial control device or a programmable logic controller (PLC), etc. and the slave refers to PI500 inverter. Master
can communicate with individUal slave, also send broadcasting information to all the lower slaves. For the single "Inquiry/Command"of master, slave will return a signal(that is a response) to master; for the broadcasting information sent by master, slave does not need to feedback a response to master.

Communication data structure PI500 series inverter's Modbus protocol communication data

## Appendix I

There are diverse character intervals under network baud rate,
which is easiest implemented. The first field transmitted is the device address.
The allowable characters for transmitting are hexadecimal 0 ... 9, A ... F. The networked devices continuously monitor network bus, including during the silent intervals. When the first field (the address field) is received, each device decodes it to find out if it is sent to their own. Following the last transmitted character, a silent interval of at least 3.5 characters marks the end of the message. A new message can begin after this silent interval.

The entire message frame must be transmitted as a continuous stream. If a silent interval of more than 1.5 characters occurs before completion of the frame, the receiving device will flushes the incomplete message and assumes that the next byte will be the address field of a new message. Similarly, if a new message begins earlier than the interval of 3.5 characters following a previous message, the receiving device will consider it as a continuation of the previous message. This will result in an error, because the value in the final CRC field is not right.

RTUframe format :

| Frame header START | Time interval of 3.5characters |
| :--- | :--- |
| Slave address ADR | Communication address: 1 to 247 |
| Command code CMD | 03: read slave parameters; 06: write slave parameters |
| Data content DATA(N-1) |  |
| Data content DATA(N-2) | Data content: address of function code parameter, numbers of |
| $\ldots \ldots . . . . . . . . . . . . . . . .$. | function code parameter, value of function code parameter, etc. |
| Data content DATA0 |  |
| CRC CHK high-order | Detection Value: CRC value. |
| CRC CHK low-order | Time interval of 3.5characters |
| END |  |

CMD (Command) and DATA (data word description)
Command code: 03 H , reads N words (max. 12 words), for example: for the inverter with slave address 01 , its start address F 0.02 continuously reads two values.

Master command information

| ADR | 01 H |
| :--- | :--- |
| CMD | 03 H |
| Start address high-order | F0H |
| Start address low-order | 02 H |
| Number of registers high-order | 00 H |
| Number of registers low-order | 02 H |
| CRC CHK low-order | CRC CHK values are to be calculated |
| CRC CHK high-order |  |

Slave responding information
When F9.05 is set to 0 :

| ADR | 01 H |
| :--- | :--- |
| CMD | 03 H |
| Byte number high-order | 00 H |
| Byte number low-order | 04 H |
| Data F002H high-order | 00 H |
| Data F002H low-order | 01 H |
| Data F003H high-order | 00 H |
| Data F003H low-order | 01 H |
| CRC CHK low-order | CRC CHK values are to be calculated |
| CRC CHK high-order |  |

When F9.05is set to 1 :

| CMD | 03 H |
| :--- | :--- |
| Byte number | 04 H |
| Data F002H high-order | 00 H |
| Data F002H low-order | 01 H |
| Data F003H high-order | 00 H |
| Data F003H low-order | 01 H |
| CRC CHK low-order | CRC CHK values are to be calculated |
| CRC CHK high-order |  |

Command Code: 06 H , write a word. For example: Write 5000 (1388H)into the address F013H of the inverter with slave address 02 H .

Master command information

| ADR | 02 H |
| :--- | :--- |
| CMD | 06 H |
| Data address high-order | F0H |
| Data address low-order | 13 H |
| Data content high-order | 13 H |
| Data content low-order | 88 H |
| CRC CHK low-order | CRC CHK values are to be calculated |
| CRC CHK high-order |  |

Slave responding information

| ADR | 02 H |
| :--- | :--- |
| CMD | 06 H |
| Data address high-order | F0H |
| Data address low-order | 13 H |
| Data content high-order | 13 H |
| Data content low-order | 88 H |
| CRC CHK low-order | CRC CHK values are to be calculated |
| CRC CHK high-order |  |

## I-2 Check mode:

Check mode - CRC mode: CRC (Cyclical Redundancy Check) adopts RTU frame format, the message includes an error-checking field that is based on CRC method. The CRC field checks the whole content of message. The CRC field has two bytes containing a 16 -bit binary value. The CRC value calculated by the transmitting device will be added into to the message. The receiving device recalculates the value of the received CRC, and compares the calculated value to the Actual value of the received CRC field, if the two values are not equal, then there is an error in the transmission.

The CRC firstly stores 0xFFFF and then calls for a process to deal with the successive eight-bit bytes in message and the value of the current register. Only the 8 -bit data in each character is valid to the CRC, the start bit and stop bit, and parity bit are invalid.

During generation of the CRC, each eight-bit character is exclusive OR(XOR) with the register contents separately, the result moves to the direction of least significant bit(LSB), and the most significant bit(MSB) is filled with 0 . LSB will be picked up for detection, if LSB is 1 , the register will be XOR with the preset value separately, if LSB is 0 , then no XOR takes place. The whole process is repeated eight times. After the last bit (eighth) is completed, the next eight-bit byte will be XOR with the register's current value separately again. The final value of the register is the CRC value that all the bytes of the message have been applied.

When the CRC is appended to the message, the low byte is appended firstly, followed by the high byte. CRC simple functions is as follows:
unsigned int crc_chk_value(unsigned char *data_value,unsigned char length)

```
    int i;
    while(length--)
    {
    crc_value^=*data_value++;
    for(i=0;i<8;i++)
    {
        if(crc_value&0x0001)
        {
            crc_value=(crc_value>>1)^0xa001;
        }
        else
        {
            crc_value=crc_value>>1;
        }
    }
    }
    return(crc_value);
}
```

## I-3 Definition of communication parameter address

The section is about communication contents, it's used to control the operation, status and related parameter settings of the inverter. Read and write function-code parameters (Some functional code is not changed, only for the manufacturer use or monitoring): the rules of labeling function code parameters address:

The group number and label number of function code is used to indicate the parameter address:
High byte: F 0 to FB (F group), A 0 to AF ( E group), B 0 to BF ( B group), C 0 to C 7 (Y group), 70 to 7 F (d group) low byte: 00 to FF , this should be written EPPROM.

For example: address F3.12 indicates F30C; Note: L0 group parameters: neither read nor change; d group parameters: only read, not change.

| parameter | Corresponding register address | parameter | Corresponding register address |
| :---: | :---: | :---: | :---: |
| $\mathrm{d} 0.00 \sim \mathrm{~d} 0.41$ | 7000~7029 | FA. $00 \sim$ FA. 07 | FA00~FA07 |
| F0.00~F0.27 | F000~F029 | Fb. $00 \sim$ Fb. 09 | $\mathrm{Fb} 00 \sim \mathrm{Fb} 09$ |
| F1.00~F1.46 | F100 ~F12E | FC. $00 \sim$ FC. 02 | FC00~FC02 |
| F2.00~F2.19 | F200~F213 | $\mathrm{E} 0.00 \sim \mathrm{E} 0.11$ | $\mathrm{A} 000 \sim \mathrm{~A} 00 \mathrm{~b}$ |
| F3.00~F3.15 | F300 ~F30F | E1.00~E1.51 | A100~A133 |
| F4.00~F4.14 | F400 ~F40E | $\mathrm{E} 2.00 \sim \mathrm{E} 2.32$ | A200~A220 |
| F5.00~F5.15 | F500~F50F | E3.00~E3.21 | A300~A315 |
| F6.00~F6.21 | F600~F615 | $\mathrm{b} 0.00 \sim \mathrm{~b} 0.35$ | B000 ~ B 023 |
| F7.00~F7.54 | F700 $\sim$ F736 | $\mathrm{y} 0.00 \sim \mathrm{y} 0.04$ | $\mathrm{C} 000 \sim \mathrm{C} 004$ |
| F8.00~F8.35 | F800~F823 | y1.00~y1.30 | C100~C11e |
| F9.00~F9.07 | F900 ~F907 |  |  |

Some parameters can not be changed during operation, but some parameters can not be changed regardless of the inverter is in what state. When changing the function code parameters, please pay attention to the scope, units, and relative instructions on the parameter.

Besides, due to EEPROM is frequently stored, it will redUce the life of EEPROM, therefore under the communication mode some function code do not need to be stored and you just change the RAM value.

If F group parameters need to achieve the function, as long as change high order F of the function code address to 0 . If E group parameters need to achieve the function, as long as change high order F of the function code address to 4 . The corresponding function code addresses are indicated below: high byte: 00 to 0 F (F group), 40 to 4 F ( E group), 50 to 5 F (B group), 60 to $67(\mathrm{Y}$ group)low byte:00 to FF, this should be written RAM.

For example:
Function code F3. 12 can not be stored into EEPROM, address indicates as 030 C ; function code E3.05 can not be stored into EEPROM, address indicates as 4305; the address indicates that only writing RAM can be done and reading can not be done, when reading, it is invalid address. For all parameters, you can also use the command code 07 H to achieve the function.

Stop/Run parameters section:

| Parameter <br> address | Parameter description | Paramete <br> r address | Parameter description |
| :---: | :--- | :---: | :--- |
| 1000 | *Communication set value(- <br> 10000 to10000)(Decimal) | 1011 | PID feedback |
| 1001 | Running frequency | 1012 | PLC step |
| 1002 | Bus voltage | 1013 | High-speed pulse input frequency, unit: <br> 0.01 kHz |
| 1003 | Output voltage | 1014 | Feedback speed, unit:0.1Hz |
| 1004 | Output current | 1015 | Remaining run time |
| 1005 | Output power | 1016 | AI1 voltage before correction |
| 1006 | Output torque | 1017 | AI2 voltage before correction |
| 1007 | Operating speed | 1018 | Reserve |
| 1008 | DI input flag | 1019 | Linear speed |
| 1009 | DO output flag | 101 A | Current power-on time |
| 100 A | AI1 voltage | 101 B | Current run time |
| 100 B | AI2 voltage | 101 C | High-speed pulse input frequency, unit: 1 Hz |
| 100 C | AI3 voltage | 101 D | Communication set value |
| 100 D | Count value input | 101 E | Actual feedback speed |
| 100 E | Length value input | 101 F | Master frequency display |
| 100 F | Load speed | 1020 | Auxiliary frequency display |
| 1010 | PID setting |  |  |

Note:
There is two ways to modify the settings frequencies through communication mode:
The first: Set F0. 03 (main frequency source setting) as $0 / 1$ (keyboard set frequency), and then modify the settings frequency by modifying F0.01 (keyboard set frequency). Communication mapping address of F 0.01 is 0 xF 001 (Only need to change the RAM communication mapping address to $0 x 0001$ ).

The second :Set F0.03 (main frequency source setting) as 9 (Remote communication set), and then modify the settings frequency by modifying (Communication settings). , mailing address of this parameter is $0 \times 1000$.the communication set value is the percentage of the relative value, 10000 corresponds to $100.00 \%,-10000$ corresponds to $-100.00 \%$. For frequency dimension data, it is the percentage of the maximum frequency ( F 0.19 ); for torque dimension data, the percentage is F5.08

## Appendix I

(torque upper limit digital setting).
Control command is input to the inverter: (write only)

| Command word address | Command function |
| :--- | :--- |
| 2000 | 0001: Forward run |
|  | 0002: Reverse run |
|  | 0003: Forward Jog |
|  | 0004: Reverse Jog |

|  | 0008: EEPROM in operation |

F9Group - Communication parameter description

|  | Baud rate | Default | 6005 |
| :---: | :---: | :---: | :---: |
|  |  | Units digit: MODUBUS baud rate |  |
| F9.00 | $0: 300 \mathrm{BPS}$ |  |  |
|  | Setting range | $1: 600 \mathrm{BPS}$ |  |
|  |  | $2: 1200 \mathrm{BPS}$ |  |
|  |  | $3: 2400 \mathrm{BPS}$ |  |
|  |  | $4: 4800 \mathrm{BPS}$ |  |
|  |  | $5: 9600 \mathrm{BPS}$ |  |

|  |  | $6: 19200 \mathrm{BPS}$ |
| :--- | :--- | :--- |
|  |  | $7: 38400 \mathrm{BPS}$ |
|  |  | $8: 57600 \mathrm{BPS}$ |
|  | $9: 115200 \mathrm{BPS}$ |  |

This parameter is used to set the data transfer rate between the host computer and the inverter. Note: the baud rate must be set to the same for the host computer and the inverter, otherwise communication can not be achieved. The larger baud rate, the faster communication speed.

| F9.01 | Data format | Default |
| :--- | :--- | :--- |

Note: the set data for the host computer and the inverter must be the same.

| F9.02 | This unit addres | Default | 1 |
| :--- | :--- | :--- | :--- |
|  | Setting range | 1 to 247, 0for broadcast address |  |

When the address of this unit is set 0 , that is broadcast address, the broadcasting function for the host computer can be achieved.

The address of this unit has uniqueness (in addition to the broadcast address), which is the basis of peer-to-peer communication for the host computer and the inverter.

| F9.03 | Response delay | Default | 2 ms |
| :---: | :---: | :---: | :---: |
|  | Response delay | $0 \sim 20 \mathrm{~ms}$ |  |

Response delay: refers to the end of the frequency converter data to the host computer to send data in the middle of the interval. If the response delay is less than the system processing time, delayed response to system processing time shall prevail, such as response delay is longer than the system processing time, system processed data, to the delay of waiting, until the response delay time to, to send data to the host computer.

| F9.04 | Communication <br> timeout | Factory value | 0.0 s |
| :---: | :---: | :---: | :---: |
|  | Response delay | 0.0 s (invalid); $0.1 \sim 60.0 \mathrm{~s}$ |  |

When the function code is set to 0.0 s , the communication timeout time parameter is invalid.
When the function code is set to a valid value, the system will report the fault fault (fault sequence number Err.16) if the communication time between the next communication and the next communication time exceeds the communication time. Usually, they are set to invalid. If you are in a continuous communication system, set the secondary parameters, you can monitor the status of the communication.

| F9.05 | Communication protocol <br> selection | Factory value | 1 |
| :---: | :---: | :--- | :--- |
|  | Response delay | 0: non standard Modbus protocol; <br> $1:$ Standard Modbus protocol |  |

F9.05=1:Select standard Modbus protocol.
F9.05=0:Read command, the return of the number of bytes from the machine is more than one byte of the standard Modbus protocol.

| F9.06 | Communication read <br> current resolution | Factory <br> value | 0 |
| :---: | :---: | :---: | :---: |
|  | Response delay | $0: 0.01 \mathrm{~A} ;$ | $1: 0.1 \mathrm{~A}$ |

The output unit of the current value is used to determine the output current of the communication read output.

## Appendix II How to use universal encoder expansion card

## III-1 Overview

PI500 is equipped with a variety of universal encoder expansion card (PG card), as an optional
accessory, it is necessary part for the inverter closed-loop vector control, please select PG card

| accoding to the form of encoder output, the sBecifictpmofels are as follows: | Others |  |
| :--- | :--- | :--- |
| JI500_PG1 | ABZ incremental encoder: <br> Differential input PG card, without frequency dividing output. <br> OC input PG card, without frequency dividing output.5V, 12V, <br> 24V voltage is optional, please provide voltage and pulse input mode <br> information when ordering. | Terminal <br> wiring |
| PI500_PG3 | UVW incremental encoder. <br> UVW Differential input PG card, without frequency dividing <br> output.5V voltage | Terminal <br> wiring |
| JI500_PG4 | Rotational transformer PG card | Terminal <br> wiring |
| JI500_PG5 | ABZ incremental encoder. <br> OC input PG card, with 1:1 frequency dividing output. <br> $5 \mathrm{~V}, 12 \mathrm{~V}, \quad 24 \mathrm{~V}$ voltage is optional, please provide voltage and pulse <br> input mode information when ordering. | Terminal <br> wiring |

## III-2 Description of mechanical installation and control terminals function

The expansion card specifications and terminal signals for each encoder are defined as follows:
Table 1 Definitions of specifications and terminal signals

## Appendix III CAN bus communication card use description

## IV-1.Overview

CAN bus communication card is suitable for all series of PI500 frequency inverters.Protocol details,please refer to 《CAN bus communication protocol》document.

## IV2.Mechanical installation and terminal functions

## IV-2-1 Mechanical installation modes:

Figure IV-1: CAN bus communication card's installation on SCB

## IV-2-2 Terminal function

| Class | Terminal Symbol | Terminal Name | Description |
| :---: | :---: | :---: | :---: |
| Communication | CANH | communication interface terminal | CANcommunication input terminal |
|  | CANL |  |  |
|  | COM | CAN communication power ground | CAN 5V power output terminal |
|  | P5V | CAN communication power output ground |  |

## Appendix IV: Instruction of Profitbus -DP communication card

## IV-1.Outline

9KDP1 meet the international standard PROFIBUS fieldbus, Fluxcon technology PI500 series inverter use it together to achieve the drive to become a part of fieldbus complete control of real fieldbus. Before using this product, please carefully read this manual

## IV-2 Terminal function

## IV-2-1 DIP switch description

| Switch positio n No. | Function | I'nstruction |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1,2 | DP Card and the drive baud rate selection | Bit 1 | Bit 2 | Baud Rate |
|  |  | OFF | OFF | 115.2K |
|  |  | OFF | ON | 208.3K |
|  |  | ON | OFF | 256K |
|  |  | ON | ON | 512K |
| 3-8 | Profibus-DP Communication from the station address | 6 Binary Consisting of 64-bit binary address, more than 64 outside the address can be set only by function code. The following lists some slave address and switch settings <br> Address switch settings |  |  |

Table V-1:Switch Functions

## IV-2-2 Terminal Function

1) External communication terminal J4-6PIN

| Termin <br> al NO | Mark | Function | Terminal <br> NO | Logo | Function |
| :---: | :---: | :--- | :---: | :---: | :--- |

## IV-2-3 LED Light function

| LEDlight | Function definition | Description |
| :---: | :--- | :--- |
| Green | Power light | If DP card and drive interfaces connected, the inverter after <br> power LED should be in the steady state |
| Red | DP CARDS and <br> frequency converter <br> serial port connect <br> light | DP Card and inverter connected to the normal state of the <br> LED is lit, flashing indicates the connection is intermittent <br> (for interference), and drive off when a serial connection is <br> unsuccessful (You can check the baud rate setting) |
| Yellow | DP card and <br> Profibusmain <br> connection <br> indicator light | DP Profibus master card and connect normal state of the <br> indicator is lit. flashing indicates the connection is <br> intermittent (for interference), and Profibus master is off <br> when connection is unsuccessful (you can check the slave <br> address, data formats, and Profibus cable ) |

Table V-4:LED light function description

## Appendix V product application case

## V-1. Single pump constant pressure water supply parameter setting

## V-1-1 Electrical Diagram:

Single pump constant pressure water supply
Note: Check the wiring is correct, close the circuit breaker, the inverter power, press the forward button for 1-2 seconds and then stop, check the pump running direction, if the direction is reversed, then change the motor wiring phase sequence

## V-1-2 Parameter setting:

| No. | Code | Parameter name | Setting range |
| :---: | :--- | :--- | :--- |
| F0.03 | Frequency source <br> master setting | PID control setting | 8 |
| F0.11 | Command source <br> selection | Terminal block control (LED on) | 1 |
| E2.00 | PID setting source | E2.01setting | 0 |
| E2.01 | PID keyboard <br> reference | $0.0 \%-100.0 \%$ | According to the <br> pressure rate to choose <br> the pressure percentage |
| E2.02 | PID feedback <br> source | Analog AI1 reference | 0 |
| E2.04 | PID reference <br> feedback range | $0-65535$ | Set it according to the <br> on-site pressure |
| E2.06 | PID deviation limit | PID deviation limit | $0.2 \%$ |
| E2.27 | Computing status <br> after PID stop | PID stop with computing | 1 |
| F7.46 | Awakens frequency | If the inverter is in hibernation mode <br> and the current running command is <br> valid, when the setting frequency is <br> greater than or equal to the wake-up | 35.00 Hz |

|  |  | frequency of F7.46, the inverter will <br> start to start after the delay time of <br> F7.47. |  |
| :--- | :--- | :--- | :--- |
| F7.47 | Awakens delay <br> time | $0.0 \mathrm{~s}-6500.0 \mathrm{~s}$ | 0.1 s |
| F7.48 | Dormancy <br> frequency | During the operation of the inverter, <br> when the set frequency is less than or <br> equal to the sleep frequency of F7.48, <br> after the delay time of F7.49, the <br> inverter will go to sleep state and stop <br> automatically | 30.00 Hz |
| F7.49 | Dormancy delay <br> time | 0.0 s-6500.0s | 0.1 s |
| FC.02 | PIDstart deviation | PID setting start deviation rate | 5.0 |

Note: Under normal circumstances, please set the wake-up frequency greater than or equal to the sleep frequency. Set the wake-up frequency and sleep frequency are 0.00 Hz , then sleep and wake-up function is invalid. When the sleep function is enabled, if the PID is used as the PID source, then whether the PID is in sleep mode or not is affected by the function code E2.27. In this case, PID operation must be stopped (E2.27 = 1). E2.01 The method of calculating the signal value given by the keyboard: E2.01 $=$ Set the pressure of the full scale of the pressure gauge $* 100 \%$, for example: The full scale of the pressure gauge is 1.0 Mpa . If the pressure of the pipe network is required to be constant at 0.4 Mpa , The value of E 2.01 is 40.0 .

## V-2 terminal block control motor forward and reverse

## V-2-1 Electrical Diagram:

Terminal control control of positive and reverse motor
Connection: Control terminal DI1 corresponds to forward command, control terminal DI2 corresponds to reverse command.

## V-2-2 Paremeters setting:

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F0.11 | Command source selection | Keyboard control (LED on) | 1 |
| F1.00 | DI1 terminal function selection | Forward running(FWD) | 1 |
| F1.01 | DI2 terminal function selection | Reverse running(REV) | 2 |

## V-3 external frequency table and ammeter

## V-3-1 Electrical Diagram:

External frequency meter and ammeter

Standard default output: DA1 default $0 \sim 10 \mathrm{~V}$; DA2 default $4 \sim 20 \mathrm{~mA}$.
V-3-2 Connection: The frequency meter is connected to the DA1 and GND terminals of the inverter, and the ammeter is connected to the DA2 and GND terminals.

## V-3-3 parameter setting:

When the system requires the drive DA1 $0-5 \mathrm{~V}$ signal output, you need to set the parameters as follows:

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F2.07 | DA1 output function selection | Running frequency | 0 |
| F2.16 | DA1 zero bias coefficient | $-100.0 \% \sim+100.0 \%$ | $0 \%$ |
| F2.17 | DA1 gain | $-10.00 \sim+10.00$ | 0.50 |

Note: DA1 jumper cap on drive control board needs to be shorted to V terminal.
When the system requires DA2 to provide $4-20 \mathrm{~mA}$ signal output, the following parameters need to be set:

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F2.08 | DA2 output function selection | output current | 2 |
| F2.18 | DA2 zero bias coefficient | $-100.0 \% \sim+100.0 \%$ | $20.0 \%$ |
| F2.19 | DA2 gain | $-10.00 \sim+10.00$ | 0.80 |

Note: The DA2 jumper cap on the control board of the inverter needs to be shorted to I terminal.

## V-4 Terminal block control forward /reverse running jog

## V -4-1 electrical diagram:

Terminal control to control positive and reverse point movement

V-4-2 Connection: Control terminal DI3 corresponds to jog command, control terminal DI4 corresponds to Jog command.

## V-4-3 Parameter setting:

\left.| No. | Code | Parameter name | Setting range |
| :---: | :--- | :--- | :---: |
| F0.11 | Command source selection | Terminal block control (LED on) | 1 |
| F1.02 | DI3 | terminal function selection | Forward JOG(FJOG) |$\right] 4$

## V-5 Multi-speed running

## V-5-1 electrical diagram

V-5-2 Connection: The control terminals DI1 and COM are short-circuited and run forward command ( 0 segment speed setting 0X). DI2, DI3 and DI4 correspond to 3 -segment speed short to COM and $100 \%$ parameter value corresponds to 50 HZ . (Take the three-stage speed as an example,
up to 16-stage speed control can be realized).

## V-5-3 Parameter setting:

| No. | Code | Parameter name | Setting range |  |
| :---: | :--- | :--- | :---: | :---: |
| F0.03 | Frequency source master <br> setting | Multi-speed operation setting | 6 |  |
| F0.11 | Command source selection | Terminal block control (LED on) | 1 |  |
| F0.13 | Acceleration time 1 | $0.0 \mathrm{~s} \sim 6500 \mathrm{~s}$ | 2.0 s |  |
| F0.14 | Deceleration time 1 | $0.0 \mathrm{~s} \sim 6500 \mathrm{~s}$ | 2.0 s |  |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |  |
| F1.01 | DI2 terminal function selection | Multi-speed terminal 1 | 12 |  |
| F1.02 | D13 terminal function selection | Multi-speed terminal 2 | 13 |  |
| F1.03 | DI4 terminal function selection | Multi-speed terminal 3 | 14 |  |
| E1.00 | 0-stage speed setting 0X | 0-stage speed frequency setting <br> percentage | $20.0 \%$ |  |
| E1.01 | 1-stage speed setting 1X | 1-stage speed frequency setting <br> percentage | $40.0 \%$ |  |
| E1.02 | 2-stage speed setting 2X | 2-stage speed frequency setting <br> percentage | $60.0 \%$ |  |
| E1.04 | 4-stage speed setting 4X | 3-stage speed frequency setting <br> percentage | $100.0 \%$ |  |
| Options: |  |  |  |  |
| E1.51 | Multi-stage command 0 <br> reference manner | $0 \sim 7$ selection, according to the <br> site requirements to set the <br> corresponding way | 0 |  |

## V-6 External potentiometer speed

## V-6-1 electrical diagram:

[^0]V-6-2 connection: The three cables of potentiometers are connected to the inverter +10 V , AII, GND terminal, note that the direction of potentiometer wiring, clockwise to the maximum corresponding maximum frequency, counterclockwise twisted to the minimum corresponding 0 Hz .

## V-6-3 Parameter setting

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F0.03 | Frequency source master setting | Analog AI1 setting | 2 |
| F0.11 | Command source selection | Terminal block control (LED on) | 1 |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |

## V-7 Keyboard potentiometer speed

## Parameter setting:

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F0.03 | Frequency source master setting | Panel potentiometer setting | 4 |
| F1.42 | Keyboard potentiometer X 2 | $0 \sim 100.00 \%$ | 1.00 |

Note: F1.42 is used to adjust the rate of change of panel potentiometer rotation frequency. The smaller this value is, the more sensitive the panel potentiometer rotation frequency changes.

## V-8. Rise / Fall Control Speed

## V-8-1 electrical diagram:

V-8-2 Connection: Three-wire control mode 1, forward command Corresponding terminal DI1, stop DI2, reverse DI3, DI4 and DI5, respectively, with the corresponding COM short rise and fall command..

## V-8-3 Parameter setting:

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F0.11 | Command source selection | Terminal block control (LED on) | 1 |
| F0.03 | Frequency source master setting | UP/DOWN can be modified, <br> power-down without memory | 1 |
| F1.10 | Terminal command mode | Three-wire control mode 1 | 2 |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |
| F1.01 | DI2 terminal function selection | Three-wire operation control | 3 |
| F1.02 | DI3 terminal function selection | Reverse run(REV) | 2 |
| F1.03 | DI4 terminal function selection | terminal UP | 6 |
| F1.04 | DI5 terminal function selection | terminal DOWN | 7 |
| F1.11 | Terminal UP/DOWN change rate | Used to set terminal UP/DOWN <br> adjustment frequency, the rate of <br> frequency change. | $1.00 \mathrm{Hz/s}$ |
| F0.10 | UP/DOWN reference | Running frequency | 0 |

## V-9. External analog speed control (external $0 \sim 10 \mathrm{~V}$ voltage signal given)

## V-9-1 electrical diagram:

External simulation speed regulation
(External $0 \sim 10 \mathrm{~V}$ voltage signal given)

V-9-2 Connection: The ( + ) terminal of the external analog signal is connected to the AIl terminal, and the other terminal of the signal is connected to the GND terminal of the inverter.
V-9-3 Parameter setting:

| No. | Code | Parameter name | Setting range |
| :--- | :---: | :---: | :---: |
| F0.03 | Frequency source master setting | AIlanalog quantity setting | 2 |

| F0.11 | Command source selection | Terminal block control (LED on) | 1 |
| :--- | :--- | :--- | :--- |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |
| F1.01 | DI2 terminal function selection | Reverse run(REV) | 2 |

## V-10. External analog speed control (external $0 \sim 20 \mathrm{~mA}$ current signal given)

## V-10-1 electrical diagram

External simulation speed regulation (external $0 \sim 20 \mathrm{~mA}$ current signal given)

V-10-2 Connection: Connect the $(+)$ end of the external reference signal to the AI2 terminal, the $(-)$ end of the signal to the GND terminal of the inverter, and the AI2 jumper cap to the I terminal.
V-10-3 Parameter setting:

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F0.03 | Frequency source master setting | AI2analog quantity setting | 3 |
| F0.11 | Command source selection | Terminal block control (LED on) | 1 |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |
| F1.01 | DI2 terminal function selection | Reverse run(REV) | 2 |
| F1.16 | Minimum input for AIC2 | $0.00 \mathrm{~V}-F 0.18$ | 0.00 V |

Note: If external $4 \sim 20 \mathrm{~mA}$ current signal is given, please set F1.16 $=2.00 \mathrm{~V}$.

## V-11. Air compressor constant pressure control (sensor for two-wire pressure transmitter)

## V-11-1 electrical diagram:

V-11-2 Connection: Short circuit between COM and GND;
+24 V , AI1 indirect pressure sensor feedback $4 \sim 20 \mathrm{~mA}$ current signal;
DI1, COM indirect "forward / stop" signal, DI2, COM connected to "fault reset" signal;
AI1 jumper cap shorted to I end.

## V-11-3 Parameter setting

| No. | Code | Parameter name | Setting range |
| :--- | :--- | :--- | :---: |
| F0.03 | Frequency source master <br> setting | PID control setting | 8 |
| F0.11 | Command <br> source <br> selection | Terminal block control (LED on) | 1 |
| F0.13 | Acceleration time 1 | $0.0 \mathrm{~s} \sim 6500 \mathrm{~s}$ | 50.0 s |
| F0.14 | Deceleration time 1 | $0.0 \mathrm{~s} \sim 6500 \mathrm{~s}$ | 50.0 s |
| F0.18 | Carrier Frequency | $0.5 \mathrm{kHz} \sim 16.0 \mathrm{kHz}$ | 4.0 kHz |
| F0.21 | Upper limit <br> frequency | $0.00 \sim$ maximum frequency <br> $(\mathrm{F0} 0.19)$ | 48.00 Hz |
| F0.23 | Upper limit <br> frequency offset | $0.00 \sim$ Upper limit <br> Frequency (F0.21) | 25.00 Hz |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |
| F1.01 | DI2 terminal function selection | Fault reset | 9 |
| F1.12 | Minimum input for AIC1 | 0.5 V corresponds to 1mA | 2.00 V |
| F3.07 | Stop mode | Free stop | 1 |
|  |  |  | Set the desired <br> pressure value <br> percentage based <br> on the pressure <br> value actually <br> required |
| E2.01 | PID keyboard reference | $0.0 \%-100.0 \%$ |  |

| E2.29 | PID automatic deceleration <br> frequency <br> option | valid | 1 |
| :---: | :--- | :--- | :---: |
| E2.27 | Computing status after <br> PID stop | PID stop with computing | 1 |

## V-12. frequency reference mode(external potentiometer, keyboard encoder) switching

## V-12-1 electrical diagram:

Frequency given mode
(external potentiometer, keyboard encoder) switching

## V-12-2 Parameter setting

| No. | Code | Parameter name | Setting range |
| :---: | :--- | :--- | :---: |
| F0.03 | Frequency source master <br> setting | Panel potentiometer setting | 4 |
| F0.04 | Frequency source auxiliary <br> setting | AI1analog quantity setting | 2 |
| F0.11 | Command source selection | Terminal block control (LED on) | 1 |
| F1.00 | DI1 terminal function selection | Forward run (FWD) | 1 |
| F1.02 | DI3 terminal function selection | Frequency source <br> switching | 18 |
| F0.07 | Frequency source <br> superimposed selection | frequency reference main / <br> auxiliary switching | 02 |

Note: DI3 and COM connected to an external potentiometer speed control, disconnect the panel potentiometer speed.

## Product information feedback

Dear user:

Thank you for your interest in and purchasing Fluxcon products! In order to better serve you, we want to be able to timely get your personal information and the related information of the purchased Fluxcon products so as to understand your further demands for our Fluxcon products, we would appreciate your valuable please
www.fluxcon.nl and then click "Technologies and Services"and "Download" columns to submit your feedback information.

1) Download the update product manuals you need
2) View the technical information on products, such as operation instructions, specifications and features, FAQ, etc.
3) Share application cases.
4) Technical advisory and online feedback
5) Feedback the product and demand information via e-mail
6) Inquire the latest products and access to various types of warranty and extend additional services

[^0]:    Speed regulation of external potentiometer
